

# The Right Compressor for the Right Job

At York,<sup>®</sup> we're committed to providing you with the most innovative comfort technology— not to mention the best performance value. That's why we utilize three different compressor technologies. That way we can match the right compressor for the best performance and efficiency. Unfortunately, some companies pick one compressor technology and design all of their single-speed units around it, creating design inefficiencies that can affect system performance and operating cost. That's never the case with York.

## Get Comfortable with Innovative Technology.

York offers engineering excellence in three types of compressors for our residential units:

**Twin-Single**—Your system operates at two capacities, creating even temperatures.

**Scroll**—Utilizes free floating spiral plates that rotate to compress the refrigerant.

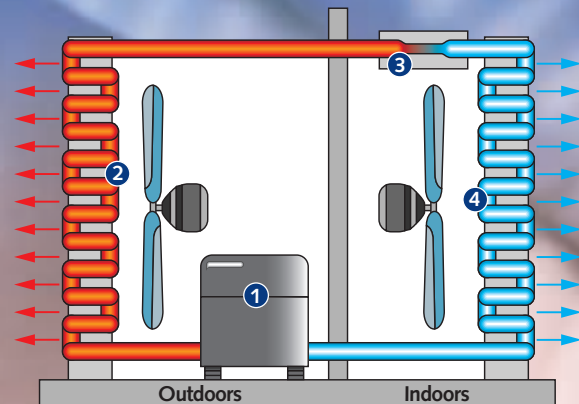

**Reciprocating**—This solid and reliable, and economical piston type compressor works well in harsh conditions.

## Get Comfortable With The Right Decision.

Having the right kind of compressor in your system impacts your home comfort system in many ways:

### Reliability

We design each unit with the right compressor in order to extend the life of the entire system, greatly reduce wear on system components, and lower maintenance costs.

### How a compressor works within your system.

- 1 The compressor compresses cool Freon gas, causing it to become hot, high-pressure Freon Gas (red, in the diagram above).
- 2 The hot gas runs through a set of condensing coils where it dissipates heat and then condenses into a liquid.
- 3 This liquid then runs through an expansion valve and evaporates, becoming cold, low-pressure Freon gas (light blue, in the diagram above).
- 4 The cold gas runs through the coils, allowing the gas to absorb heat and cool down the air inside.

### Efficiency

We design each unit with the right compressor in order to create more productive heating and cooling cycles, use less energy to provide better comfort, and reduce energy costs.

### Comfort

The right compressor provides whisper-quiet performance inside and outside your home, better humidity control, and even temperatures, minimizing hot and cold spots.

# It's Time to Get Comfortable WITH YORK'S COMPRESSOR TECHNOLOGY

## Twin-Single Compressor Technology.

A typical central air conditioner runs at one speed—"full blast"—when cycled on. Which means the indoor temperatures fluctuate far above and below the temperature you've set—and the comfort level you want. York's innovative Twin-Single technology has two cooling stages: one to handle the hottest days and one to handle the more common non-peak cooling times. The compressor switches to high capacity for very hot weather, but runs

at a lower capacity as much as 85 percent of the time during average demand periods. This means you get:

- Even temperatures with 60 percent fewer start/stop cycles.
- Better air circulation and humidity control.
- Sixty-five percent less energy required to run at low capacities.

## Scroll Compressor Technology.

Nearly a century old, the scroll compressor is a time-tested technology. Fewer parts—only two—make up the heart of the scroll compressor, so the motion is smooth and even. And the parts are resistant to liquid and debris corruption, unlike other compressors. With its simple, practical design, the scroll compressor will:

- Reduce wear on the system.
- Operate quietly because of limited motion.
- Decrease maintenance costs.
- Typically provides higher efficiencies for larger tonnage applications.

## Reciprocating Compressor Technology.

Reciprocating compressors use a piston to compress refrigerants, much the way the piston in your car's engine works. Because of its proven history, this compressor will have stood the test of time in millions of homes before it gets to yours.

Reciprocating compressors:

- Are extremely rugged, economical, and dependable.
- Work well in harsh conditions – even up to temperatures of 150 degrees!
- Typically provides higher efficiencies for smaller tonnage applications.

## Count on York, Your Comfortable Choice.

York is committed to making sure you receive the best home comfort system for your needs. That's why York selects the right compressor for each system, so that you'll receive the best value, operating efficiency, and home comfort. Unlike other manufacturers that use the same compressor in every unit, York always chooses the appropriate compressor to maximize the performance of your air conditioning or heat pump system. You can feel comfortable about getting quality in design, engineering, and manufacturing... because York only produces the best.

## It's Time To Get Comfortable.

Remember, you don't need to be an expert on air conditioning system components. You just need to ask the expert—your York Dealer—to help you make the right choice for your home, your lifestyle, and your budget.
